

Dear students,

pay attention to the Python code you upload along with your lab reports.

- The code has to be correct, properly commented (so we can understand what you are doing) and should be executable out-of-the-box by us to verify what you reported in the lab report. If you are unclear what constitutes “proper” commenting, check this article: [Best practices for writing code comments](#). A short list of these practices is as follows:
  - ✓ Rule 1: Comments should not duplicate the code.
  - ✓ Rule 2: Good comments do not excuse unclear code.
  - ✓ Rule 3: If you can’t write a clear comment, there may be a problem with the code.
  - ✓ Rule 4: Comments should dispel confusion, not cause it.
  - ✓ Rule 5: Explain unidiomatic code in comments.
  - ✓ Rule 6: Provide links to the original source of copied code.
  - ✓ Rule 7: Include links to external references where they will be most helpful.
  - ✓ Rule 8: Add comments when fixing bugs.
  - ✓ Rule 9: Use comments to mark incomplete implementations.
- In case your file structure is somewhat complicated (e.g., multiple files etc.), then please include a short README note explaining what is what.
- Reports that attach non-running or irrelevant Python code will only count for half the lab mark (i.e., a -5 point penalty). *Of course, if assignments have been partially completed, Python code has to only cover those parts.*
- Name your files using **L1\_Qx.py** convention. L1 refers to the lab number (L1 for lab 1, L2 for lab 2, ...) and Qx refers to the exercise you are submitting the code for. For example, L1\_Q7.py is the code associated with exercise 7 of the first lab.

Best regards,

Christos
